Question ST 33.2023

Gagan Singla - EE22BTECH11021

Question: Let $\{W_t\}_{t\geq 0}$ be a standard Brownian motion. Then $E\left(W_4{}^2\middle| W_2 = 2\right)$ in integer equals

Solution:

Parameter	Description
μ_x	Mean of x
$Var(x)$	Variance of x
$Cov(x, y)$	Covariance between x and y
σ_x	Standard deviation of x
ρ	Co-Relation coefficiant
$E(x)$	Expectation of x

In standard brownian motion,

$$W_i \sim N(0, i) \tag{1}$$

$$Cov\left(W_i, W_j\right) = \min(i, j) \tag{2}$$

Now, we know that,

$$E\left(Y^2\middle| X\right) = Var(Y|X) + (E(Y|X))^2 \tag{3}$$

X and Y can be represented as:

$$X = \sigma_X Z_1 + \mu_X \tag{4}$$

$$Y = \sigma_Y\left(\rho Z_1 + \sqrt{1 - \rho^2}Z_2\right) + \mu_Y \tag{5}$$

where Z_1 and Z_2 are normal distributions.

$$Z_1, Z_2 \sim N(0, 1) \tag{6}$$

Writing the above equations in matrix form,

$$\begin{bmatrix} X \\ Y \end{bmatrix} = \begin{bmatrix} \sigma_X & 0 \\ \sigma_Y\rho & \sigma_Y\sqrt{1-\rho^2} \end{bmatrix}\begin{bmatrix} Z_1 \\ Z_2 \end{bmatrix} + \begin{bmatrix} \mu_X \\ \mu_Y \end{bmatrix} \tag{7}$$

This can be represented as,

$$\mathbf{x} = A\mathbf{z} + \boldsymbol{\mu} \tag{8}$$

Taking expectation both sides,

$$E(\mathbf{x}) = E(A\mathbf{z} + \boldsymbol{\mu}) \tag{9}$$

$$= AE(\mathbf{z}) + E(\boldsymbol{\mu}) \tag{10}$$

$$= \boldsymbol{\mu} \tag{11}$$

We know that covariance matrix for X and Y is given by:

$$\sigma_{\mathbf{z}} = E\left((\mathbf{x} - \mu)(\mathbf{x} - \mu)^T\right) \tag{12}$$

$$= E\left((A\mathbf{z})(A\mathbf{z})^T\right) \tag{13}$$

$$= E\left(A\mathbf{z}\mathbf{z}^T A^T\right) \tag{14}$$

$$= AE\left(\mathbf{z}\mathbf{z}^T\right)A^T \tag{15}$$

Multiplying $\mathbf{z}$ and $\mathbf{z}^T$ we get,

$$\mathbf{z}\mathbf{z}^T = \begin{bmatrix} Z_1 \\ Z_2 \end{bmatrix}\begin{bmatrix} Z_1 & Z_2 \end{bmatrix} \tag{16}$$

$$= \begin{bmatrix} Z_1{}^2 & Z_1Z_2 \\ Z_1Z_2 & Z_2{}^2 \end{bmatrix} \tag{17}$$

We know that,

$$Var(Z_1) = E\left((Z_1 - \mu)^2\right) \tag{18}$$

$$E\left(Z_1^2\right) = 1 \tag{19}$$

Same goes for Z_2 as Z_1 and Z_2 are both normal distributions.

Taking expectation both sides in equation (17),

$$E\left(\mathbf{z}\mathbf{z}^T\right) = \begin{bmatrix} E\left(Z_1^2\right) & E(Z_1Z_2) \\ E(Z_1Z_2) & E\left(Z_2^2\right) \end{bmatrix} \tag{20}$$

$$= \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \tag{21}$$

Hence,

$$\sigma_{\mathbf{z}} = AA^T \tag{22}$$

$$= \begin{bmatrix} \sigma_X & 0 \\ \sigma_Y\rho & \sigma_Y\sqrt{1-\rho^2} \end{bmatrix}\begin{bmatrix} \sigma_X & \sigma_Y\rho \\ 0 & \sigma_Y\sqrt{1-\rho^2} \end{bmatrix} \tag{23}$$

$$= \begin{bmatrix} (\sigma_X)^2 & \sigma_X\sigma_Y\rho \\ \sigma_X\sigma_Y\rho & (\sigma_Y)^2 \end{bmatrix} \tag{24}$$

The Co-Relation Coefficiant is given by:

$$\rho = \frac{Cov(X, Y)}{\sqrt{Var(X)Var(Y)}} \tag{25}$$

Substituting value of Z_1 in Y,

$$Y = \sigma_Y\rho\left(\frac{X - \mu_X}{\sigma_X}\right) + \sigma_Y\sqrt{1 - \rho^2}Z_2 + \mu_Y \tag{26}$$

This an equation of Y in terms of X. All the terms except Z_2 are constants. Taking expectation on both sides,

$$E(Y|X = x) = E\left(\sigma_Y\rho\left(\frac{x - \mu_X}{\sigma_X}\right) + \sigma_Y\sqrt{1 - \rho^2}Z_2 + \mu_Y\right) \quad (27)$$

$$= E\left(\sigma_Y\rho\left(\frac{x - \mu_X}{\sigma_X}\right) + \mu_Y\right) + E\left(\sigma_Y\sqrt{1 - \rho^2}Z_2\right) \quad (28)$$

$$= \mu_Y + \rho\left(\frac{\sigma_Y}{\sigma_X}\right)(x - \mu_X) + \sigma_Y\sqrt{1 - \rho^2}E(Z_2) \quad (29)$$

Now for variance,

$$Var(Y|X = x) = Var\left(\sigma_Y\rho\left(\frac{x - \mu_X}{\sigma_X}\right) + \sigma_Y\sqrt{1 - \rho^2}Z_2 + \mu_Y\right) \quad (30)$$

$$= Var\left(\sigma_Y\rho\left(\frac{x - \mu_X}{\sigma_X}\right) + \mu_Y\right) + Var\left(\sigma_Y\sqrt{1 - \rho^2}Z_2\right) \quad (31)$$

Variance of constants terms is 0.

$$Var(Y|X = x) = Var\left(\sigma_Y\sqrt{1 - \rho^2}Z_2\right) \quad (32)$$

$$= \left(1 - \rho^2\right)\sigma_Y{}^2Var(Z_2) \quad (33)$$

Z_2 is a normal distribution so,

$$E(Z_2) = 0 \quad (34)$$

$$Var(Z_2) = 1 \quad (35)$$

By substituting these values in above equations,

$$E(Y|X = x) = \mu_Y + \rho\left(\frac{\sigma_Y}{\sigma_X}\right)(x - \mu_X) \quad (36)$$

$$Var(Y|X = x) = \left(1 - \rho^2\right)\sigma_Y{}^2 \quad (37)$$

In our case,

$$Y = W_4 \quad (38)$$

$$X = W_2 \quad (39)$$

$$x = 2 \quad (40)$$

Hence, we get that,

$$\mu_X = \mu_Y = 0 \quad (41)$$

$$\sigma_X = \sqrt{2} \quad (42)$$

$$\sigma_Y = 2 \quad (43)$$

$$\rho = \frac{2}{\sqrt{8}} \quad (44)$$

$$= \frac{1}{\sqrt{2}} \quad (45)$$

Substituting the values in above equations,

$$E(Y|X = 2) = \frac{1}{\sqrt{2}} \cdot \frac{2}{\sqrt{2}} \cdot 2 \quad (46)$$

$$= 2 \quad (47)$$

$$Var(Y|X = 2) = \left(1 - \frac{1}{2}\right)(2)^2 \quad (48)$$

$$= \frac{1}{2} \cdot 4 \quad (49)$$

$$= 2 \quad (50)$$

Substituting these values in (3),

$$E\left(Y^2\big|X = 2\right) = 2 + (2)^2 \quad (51)$$

$$= 6 \quad (52)$$

$$E\left(W_4{}^2\big|W_2 = 2\right) = 6 \quad (53)$$

Steps for Simulation:

1) Set the number of samples to be generated as 10000
2) Write a function to generate a uniform distribution
3) Write a function to generate a normal distribution by using the uniform distribution function defined above through box muller method
4) Write a function to generate value of **z** from one the column of the dist matrix
5) Write a function to calculate **x** by matrix multiplication: $\mathbf{x} = A\mathbf{z} + \mathbf{u}$.
6) Write a function to store values of each vector **x** obtained in a 2D array of size 2*numsamples
7) Make a temporary 2D array(dist) of size 2x10000 to store the values of Z_1 and Z_2 obtained after calling the normal distribution function
8) Use a for loop to store the values obtained by calling the normal function multiple times
9)
10) Assume values for constants,

$$\sigma_X = 0.5 \quad (54)$$

$$\sigma_Y = 0.8 \quad (55)$$

$$\rho = 0.5 \quad (56)$$

$$\mu_X = 1 \quad (57)$$

$$\mu_Y = 1.5 \quad (58)$$

11) Create A matrix and vector $\boldsymbol{\mu}$ and fill the values assumed above in these, the dimension for matrix is 2x2 and the vector 2x1

12) Make a 2D array(ans) to store the final values of **x** obtained after matrix multiplication

13) For each iteration, create a **z** assign values from one of the columns from dist to **z** using the function defined above

14) For each iteration, Generate **x** vector and call the function to solve to matrix multiplication and give value for **x**

15) Store the values obtained from matrix multiplication in the ans array using the store function defined above

16) The ans array has the values of **x** for 10000 simulations.
